Contents

1 Introduction **1**

2 Continuum mechanics and theory of inelastic material behaviour **5**
2.1 Continuum mechanical preparations 5
2.1.1 Balance equations 6
2.1.2 Thermodynamics with internal variables 6
2.1.3 Phase transformations 8
2.1.4 Heat equation 10
2.1.5 Mechanics 13
2.2 Specific cases of inelastic material behaviour 15
2.2.1 Classical plasticity 15
2.2.2 Modelling of creep 18
2.2.3 Material laws for TRIP 19
2.2.4 Modelling using multi-mechanism models 21
2.3 Modelling of phase transformations during heating and austenitisation 21
2.4 Problem setting 24

3 Multi-mechanism models **27**
3.1 General introduction 27
3.1.1 General multi-mechanism models (in series) 28
3.2 Two-mechanism models 30
3.2.1 Two-mechanism models with one criterion (2M1C) for plasticity 31
3.2.2 Two-mechanism models with two criteria (2M2C) for plasticity 36
3.3 Modelling of creep by means of two-mechanism models 40
3.3.1 Modelling of creep using a 2M1C model 40
3.3.2 Modelling of creep using a 2M2C model 43
3.3.3 Thermodynamic consistency 45
3.4 A two-mechanism model for the modelling of creep and TRIP . . . 47
3.4.1 Evolution equations 48
3.4.2 Thermodynamic consistency 50

4 Model verification and parameter identification **51**
4.1 Preliminaries 51
4.1.1 Three-dimensional setting for a one-dimensional stress state 51
4.1.2 One-dimensional version of material laws 53
4.2 Deriving further data from uniaxial experiments 54

4.3 Verification of material laws using uniaxial experimental data . . . 56
4.3.1 Direct problem: General strain-driven approach 57
4.3.2 Direct problem: General stress-driven approach 59
4.4 Verification of material laws for creep 60
4.4.1 Discretised version of the model equations (1D) 60
4.4.2 Direct problem: Strain-driven approach for creep 60
4.4.3 Direct problem: Stress-driven approach for creep 62
4.5 Verification of material laws for TRIP 63
4.5.1 Discretised version of the model equations (1D) 63
4.5.2 Strain-driven approach for TRIP 63
4.5.3 Stress-driven approach for TRIP 64
4.6 Parameter identification 65
4.6.1 Experimental data 65
4.6.2 General strategy 66
4.6.3 Parameter identification in the case of creep 67
4.6.4 Parameter identification for TRIP 70

5 Discretisation of the 3D model 71
5.1 Weak formulation 71
5.1.1 Weak form of heat equation 72
5.1.2 Weak form of deformation equation 73
5.2 Numerical solution scheme 74
5.2.1 Time discretisation 74
5.2.2 Spatial discretisation 75
5.2.3 Overall solution scheme 75
5.3 Application of the Finite Element Method 76
5.3.1 Discretised heat equation 76
5.3.2 Phase transitions 77
5.3.3 Discretised deformation equation 78
5.3.4 Strain and stress tensor 78
5.4 Numerical algorithm for the calculation of inelastic quantities . . . 79
5.4.1 Algorithm for creep 80
5.4.2 Algorithm for creep with a back stress 81
5.4.3 Algorithm in the case of creep without back stress 85

6 Simulation results, validation with experimental data 89
6.1 Creep of the bearing steel SAE 52100 (100Cr6) (1D case) 90
6.1.1 Results from uniaxial experiments 90
6.1.2 Results from parameter identifications 94
6.2 Creep and TRIP of the bearing steel SAE 52100 (100Cr6) (1D case) 100
6.2.1 Experimental results 101
6.2.2 Simulation results 101
6.3 3D Simulation and validation with workpiece experiments 106
6.4 Creep during heating and austenitisation (3D case) 108
6.4.1 3D Simulation of a beam 108

6.4.2 Evolution in single nodes of geometry 118
6.4.3 Validation by experimental data 125
6.4.4 3D Simulation of a steel ring 129

7 Outlook **133**

A Semi-implicit version of numerical algorithm **135**

Bibliography **139**
