1	Introduction to cooperative control of networked vehicles	1
1.1	Networked control systems	1
1.2	Goal of this thesis	2
1.3	Fields of application	3
1.3.1	Autonomous vehicles	3
1.3.2	Swarms of mobile systems	5
1.4	Open questions	6
1.5	Literature overview	6
1.5.1	Networked control systems	6
1.5.2	Control of networked vehicles	7
1.5.3	Externally positive systems	7
1.5.4	Design of communication structures	8
1.5.5	Swarms of mobile agents	9
1.6	Contributions of this thesis	10
1.6.1	Design of externally positive feedback loops	11
1.6.2	Maintenance of a proximity communication network	11
1.6.3	Collision avoidance in swarms of mobile systems	11
1.6.4	Experimental evaluation of the theoretical results	12
1.7	Structure of this thesis	12
2	Preliminaries and fundamentals	15
2.1	Notation	15
2.2	Description of linear time-invariant systems	16
2.2.1	Description in the time domain	16
2.2.2	Description in the frequency domain	17
2.3	Fundamentals of control theory	17
2.3.1	Controllability	17
2.3.2	State feedback loops and pole assignment	19
2.4	Networked control systems	21
2.4.1	Description of networked control systems	21
2.4.2	Delay measure	23

3	Externally positive systems	25
3.1	Introduction to externally positive systems	25
3.1.1	The notion of positive systems	25
3.1.2	Externally positive feedback loops	26
3.2	Further conditions on external positivity	27
3.2.1	Necessary conditions	27
3.2.2	Sufficient conditions	29
3.3	On the design of externally positive feedback loops	31
3.3.1	Design problem	31
3.3.2	Existence of a solution	32
3.3.3	Controller design for positively decomposable plants	34
3.4	Summary and literature notes	37
4	Vehicle platooning	39
4.1	Introduction to adaptive cruise control	39
4.1.1	Description of the control problem	39
4.1.2	Required platoon behaviour	41
4.2	General design objectives	41
4.2.1	Model of a controlled vehicle	41
4.2.2	Asymptotic behaviour of a controlled vehicle	43
4.2.3	String stability and collision avoidance	44
4.2.4	Summary of the design objectives	49
4.3	Design of adaptive cruise controllers	51
4.3.1	Way of solution	51
4.3.2	Vehicle model	52
4.3.3	Extended state feedback control structure	54
4.3.4	Determination of the feedback gain	57
4.3.5	Determination of eigenvalues that achieve external positivity	60
4.3.6	Summary of the design procedure	66
4.3.7	Application example	67
4.4	Summary and literature notes	69
5	Delaunay triangulation networks	71
5.1	The Delaunay triangulation	71
5.1.1	Introduction to proximity networks	71
5.1.2	Definition of the Delaunay triangulation	72
5.1.3	Important properties of the Delaunay triangulation	74
5.2	Local geometric characterisation of the Delaunay triangulation	75
5.2.1	Metrics to test geometric configurations	75
5.2.2	Local Delaunay test	79
5.3	Distributed algorithms to maintain a Delaunay triangulation	81
5.3.1	The Lawson flip	81

5.3.2	Local information	82
5.3.3	Distributed implementation of the Lawson flip	84
5.3.4	Procedure for the convex hull	86
5.3.5	Summary of the procedure	89
5.4	Summary and literature notes	91
6	Swarms of mobile agents	93
6.1	Introduction to swarming	93
6.2	Control of mobile agents with artificial potential fields	95
6.2.1	Geometric and kinematic description of a mobile agent	95
6.2.2	Artificial potential fields	96
6.2.3	A gradient-based control law	98
6.3	Distance-based formations with guaranteed collision avoidance	102
6.3.1	Problem statement	102
6.3.2	Collision avoidance with diverging potential functions	103
6.3.3	Morse potential function	104
6.3.4	Parametrisation of Morse potential functions	106
6.3.5	Collision avoidance with Morse potential functions	108
6.4	Combination of Morse potential functions with Delaunay networks	109
6.4.1	The Delaunay triangulation as a communication network	109
6.4.2	Properties of the Lawson flip	110
6.4.3	Collision avoidance with the Delaunay triangulation	112
6.4.4	Summary of the procedure	114
6.5	Summary and literature notes	114
7	Practical implementation and experimental evaluation	117
7.1	SAMS: Synchronisation of autonomous mobile systems	117
7.1.1	Set-up of the laboratory plant	117
7.1.2	Mathematical description of a robot	119
7.1.3	List of experiments	120
7.2	Path tracking control	121
7.2.1	Introduction to path tracking	121
7.2.2	A gradient-based path tracking controller	122
7.2.3	Construction of paths	128
7.2.4	Design of a velocity controller	132
7.2.5	Experimental evaluation of the path controller	135
7.2.6	Summary of path control	136
7.3	Vehicle platooning	137
7.3.1	Aim of the experiments	137
7.3.2	Combined lateral and longitudinal control	138
7.3.3	Platoon with \mathcal{L}_2 string stable vehicles	139
7.3.4	Platoon with externally positive vehicles	141

Contents

7.3.5	Discussion of the results	143
7.3.6	Extension: Merging of multiple platoons	144
7.3.7	Summary of vehicle platooning	149
7.4	Distance-based formation control	151
7.4.1	Swarms of mobile robots	151
7.4.2	Nominal test scenario	151
7.4.3	Robot formation	152
7.4.4	Summary of distance-based formations	156
7.5	Transition problem	157
7.5.1	Introduction to the transition problem	157
7.5.2	Extended potential field	157
7.5.3	Circle experiment	159
7.5.4	Summary of the transition problem	161
7.6	Summary and literature notes	162
8	Conclusion	163
	Bibliography	165
	List of Symbols	175
